Symbols

@

= address in hex

\$

= number contextdependent

~

= condition- & command-dependent s.t?

L

= length in bytes

C

= hex-character

(...)

= (unit,offset in [s]\$)(memory-@,length-\$)
\$# offset in sectors ,#\$ offset in K-Bytes

unitnumber layout:

0000 = 4 digit hex number (leading zeros are redundant)

1111> partition: addressable parts on 1 unit (like floppy and disk)

111> unit: physical unit (like floppy drive, disk drive, LUN

11 with SCSI) connected to a device

11> device: SCSI ID (up to 7 units may be connected to 1 SCSI ID)

1> controller: currently not used. *C is doing the job.

ATTENTION! The unit number is now interpreted as a hex number!
(f.e. FL0 is now 20 not 32 anymore).

SINIX commands

bootloc string	define Systemboot location
bootdr drivetype	define Systemboot drive
bootloc?	print the defined location and the location the firmware booted from
sinixloc string	define the kernel location
sinixloc?	print the defined kernel location
SI?	this help

If string contains more than 1 command, enclose string in ""

valid drivetypes:

0: 5 1/4" DD-Floppy, 0mti	1: 5 1/4" DD-Floppy
2: 5 1/4" SD/DD-Floppy	3: 3 1/2" ND-Floppy
4: 5 1/4" HD-Floppy	5: 3 1/2" HD-Floppy
6: Harddisk (ESDI)	7: Harddisk (ST506)
8: Streamer (QIC)	9: SCSI Floppy
10: SCSI Harddisk	11: SCSI Streamer
12: SCSI CD-ROM	13: invalid
